There are few complete technical sources of information available for plastic injection moulders to use relating to automation. This review has been compiled by researching and analysing technical references. It is intended to describe the basics of the technology and to explain how to put the technology to use. The review is supplemented by an indexed section containing several hundred abstracts from the Polymer Library.

A comprehensive review of the principles and dynamics of robotic systems Dynamics and Control of Robotic Systems offers a systematic and thorough theoretical background for the study of the dynamics and control of robotic systems. The authors-noted experts in the field-highlight the underlying principles of dynamics and control that can be employed in a variety of contemporary applications. The book contains a detailed presentation of the precepts of robotics and provides methodologies that are relevant to realistic robotic systems. The robotic systems represented include wide range examples from classical industrial manipulators, humanoid robots to robotic surgical assistants, space vehicles, and computer controlled milling machines. The book puts the emphasis on the systematic application of the underlying principles and show how the computational and analytical tools such as MATLAB, Mathematica, and Maple enable students to focus on robotics' principles and theory. Dynamics and Control of Robotic Systems contains an extensive collection of examples and problems and: Puts the focus on the fundamentals of kinematics and dynamics as applied to robotic systems Presents the techniques of analytical mechanics of robotics Includes a review of advanced topics such as the recursive order N formulation Contains a wide array of design and analysis problems for robotic systems Written for students of robotics, Dynamics and Control of Robotic Systems offers a comprehensive review of the underlying principles and methods of the science of robotics.

An introduction to the manufacturing industry Essential Manufacturing provides a comprehensive introduction to the wide breadth of the manufacturing industry. There is a need for all engineering and business students to understand the importance and context of the manufacturing industry. An engineer should have a well rounded appreciation of all aspects of the industry they work in, including manufacturing. This is evidenced by professional bodies expecting all accredited engineering courses to provide students with a background that allows them to see their own specific discipline in context. Similarly, business students will often find themselves dealing in some way with manufactured products or even be directly involved in manufacturing operations management. This book will cover the full spectrum of the manufacturing industry to provide a holistic appreciation of the topic but with enough detail to be of practical use. The book begins with an introduction to the manufacturing industry, its history, and some important manufacturing concepts. The materials used in manufacturing and how they are produced are covered. This is followed by a more detailed description of the more common manufacturing processes, their application, and the types of automation used in the manufacturing industry. Consideration is then given to the important aspects of manufacturing operations management and production planning and control, work study, and manufacturing economics. How to maintain quality in the manufacturing process, including metrology, is examined and this is followed by human factors in manufacturing. Finally, a speculative look at the future of manufacturing is included. Key features: Takes a self-contained approach. Includes review questions. Suitable as an introduction for more advanced study. Satisfies the requirements of college and first and second year university engineering courses. The book provides a comprehensive, concise introduction to the manufacturing industry for engineering and management students.

This state-of-the-art survey presents a coherent summary of research and development in case-based reasoning (CBR) undertaken in Germany in recent years. The book opens with a general introduction to CBR presenting the basic ideas and concepts, setting the terminology, and looking at CBR from some new points of view. The main part of the book, consisting of nine chapters, is devoted to detailed presentations of CBR applications successfully performed in various areas. Among these application areas are decision and sales support, text processing, adaptation, planning, design, software engineering, tutoring systems, and medicine. The remaining chapters present areas related to CBR as well as a glossary, a subject index and bibliography.

The industrial application of robots is growing steadily. This is reflected in the number of manufacturers now involved in the field of robotics. Thanks to pioneers such as Joseph Engelberger of Unimation Inc, industry has seen their rapid deployment in all areas of manufacturing. Manufacturers of robots and robotic equipment have increased their production levels and at the same time have made great efforts to improve and adapt their products to allow them to be used for a wider range of applications. The demand for ever more sophisticated robotic devices has made the choice of robot for a particular application an extremely hard one. Industrial Robot Specifications has been compiled to enable users to assess robotics in the context of their own needs. The book contains detailed information on over 300 robots manufactured and distributed under licence throughout Europe. More than 90 companies are covered, and details are given of their distributors and agents, regional addresses and names of key contacts. Information is provided on robots as diverse as simple teaching machines, costing perhaps £1500, to those highly sophisticated computer-controlled robot devices commonly found in flexible manufacturing systems, costing tens of thousands of pounds each. Introduction Industrial Robot Specifications is divided into three sections: adjustable mechanisms that command manipulation.

Fruit d'une étroite collaboration entre la recherche universitaire et le monde de l'industrie, cet ouvrage traite de la robotique industrielle, et tout particulièrement de l'étalonnage des robots manipulateurs. Il développe les aspects suivants : la représentation des structures des robots manipulateurs sériels et parallèles ; les principes généraux de l'étalonnage ; les méthodes d'étalonnage spécifiques aux robots sériels et parallèles ; l'innovation en robotique, ses réussites et ses échecs. Théorique et pragmatique, il s'adresse aux étudiants et aux chercheurs, aux techniciens et aux ingénieurs et à tous ceux qui désirent appréhender la robotique industrielle. Patrick Maurine est maître de conférences à l'INSA de Rennes. Ses travaux portent sur la précision et l'étalonnage des robots manipulateurs industriels. Jean-François Quinet est consultant en robotique appliquée à l'ensemble de l'industrie internationale depuis 1973. Ses activités portent aussi sur la mesure tridimensionnelle statique et dynamique.

This review has been written as a practical guide to rubber injection moulding. Many injection moulding processes produce rejects or scrap, because they depend on a b257 of variables. To eliminate waste it is necessary to learn how to recognise the variables that cause problems, and then experiment to understand their interdependence. This can be developed to a fine art and lead towards 'right first time' processing, the commercial ideal. An additional indexed section containing several hundred abstracts from the Rapra Polymer Library database gives useful references for further reading.
