BIOLOGY OF TOOTH  
MOVEMENT By: Dr  
shabeel pn. 2.

Introduction

Orthodontic tooth  
movement is a unique  
process where a solid  
object (tooth) is made to

# Acces PDF The Biology Of

move through a solid  
medium (bone).

Orthodontic treatment is possible due to the fact that whenever a prolonged force is applied on a tooth, bone remodelling occurs around the tooth resulting in its movement .

Orthodontic tooth movement (OTM) is facilitated by remodeling of the dental and paradental tissues which, when exposed to varying degrees of magnitude, frequency and duration of mechanical loading, express extensive physical and chemical changes that differ from the processes of

inside its bony socket.

Second phase when the tooth movement stops for 20 to 30 days. After the removal of necrotic tissue formed during the second phase , tooth movement is accelerated in the third phase and continues into the fourth linear phase.

The physical behavior  
of tooth movement due  
to orthodontic force

# Acces PDF The Biology Of

relies on Newton's  
Laws. The tooth  
biological system reacts  
to variation in force  
magnitude, time of  
application and  
directionality through  
receptor cells and  
signaling cascades that  
ultimately produce bone  
remodeling and  
orthodontic tooth  
movement (OTM).
