Advances in genetic analysis have revealed the first glimmerings of an older origin for *H. sapiens*, with the discovery that we and our sister species, the Neanderthals, shared a last common ancestor about half a million years ago. Such developments have led some to question the classification of a diverse array of early fossils from across Africa.

The origin of our species is largely a description of what we know about human origins. It is not an autobiography, but Stringer's personal involvement in the saga comes through very well just the same. The debates are there too, and these days it is easy to forget that those areas where there is now consensus were once rather more fiercely fought over. In the 1970s and 1980s, there were far ...

On the Origin of Species. England became quieter and more prosperous in the 1850s, and by mid-decade the professionals were taking over, instituting exams and establishing a meritocracy. The changing social composition of science—typified by the rise of the freethinking biologist Thomas Henry Huxley—promised a better reception for Darwin. Huxley, the philosopher Herbert Spencer, and other ...

In this ground-breaking book Chris Stringer sets out to answer all the big questions in the debate about our origins. How can we define modern humans, and how can we recognise our beginnings in the fossil and archaeological record? How can we accurately date fossils, including ones beyond the range of radiocarbon dating? What does the genetic data really tell us? Were our origins solely in Africa? Are modern humans a distinct species from ancient people such as the Neanderthals? And what contact did our ancestors have with them? How can we recognise modern humans behaviourally, and were traits such as

complex language and art unique to modern humans? What forces shaped the origins of modern humans - were they climatic, dietary, social, or even volcanic? What drove the dispersals of modern humans from Africa, and how did our species spread over the globe? How did regional features evolve, and how significant are they? What exactly was the 'Hobbit' of the island of Flores, and how was it related to us? Has human evolution stopped, or are we still evolving? What can we expect from future research on our origins? This book will make every reader think about what it means to be human.

This book evaluates the claims of scientific creationism versus materialistic evolution, while examining other scenarios. Consistently philosophical in methodology and perspective, the book is radically interdisciplinary in content, examining data and arguments drawn from natural science, philosophy, and theology. This work challenges the limits of human knowledge regarding every major question touching on human origins.

Where did we come from? Where are we going? Richard Leakey and Roger Lewin continue the pioneering field work of Louis and Mary Leakey by fitting together the pieces of our past to discover new answers to these age-old questions. The authors explore our long-buried

past--from the feral roots of humanity, through the eons of time, to society today, replete with its wonders and anomalies--searching for valuable insights into the future of modern society. In this vast survey of human origins and evolution, Leakey and Lewin present intriguing scientific information in such a way that the general reader will be fascinated and drawn into the search. "One of the most readable and informative books of its kind." -- Ashley Montagu, Saturday Review "It is a pleasure to see in print an authentic representation of what are, with only minor exceptions, the views held by most of the professionals in the field. Graced with humor, intriguing ideas, and unfamiliar insights." -- Carl Sagan, The New York Times Book Review

A leading researcher on human evolution proposes a new and controversial theory of how our species came to be. In this groundbreaking and engaging work of science, world-renowned paleoanthropologist Chris Stringer sets out a new theory of humanity's origin, challenging both the multiregionalists (who hold that modern humans developed from ancient ancestors in different parts of the world) and his own "out of Africa" theory, which maintains that humans emerged rapidly in one small part of Africa and then spread to replace all other humans within and outside the

continent. Stringer's new theory, based on archeological and genetic evidence, holds that distinct humans coexisted and competed across the African continent—exchanging genes, tools, and behavioral strategies. Stringer draws on analyses of old and new fossils from around the world, DNA studies of Neanderthals (using the full genome map) and other species, and recent archeological digs to unveil his new theory. He shows how the most sensational recent fossil findings fit with his model, and he questions previous concepts (including his own) of modernity and how it evolved. Lone Survivors will be the definitive account of who and what we were, and will change perceptions about our origins and about what it means to be human.

Ancestral DNA, Human Origins, and Migrations describes the genesis of humans in Africa and the subsequent story of how our species migrated to every corner of the globe. Different phases of this journey are presented in an integrative format with information from a number of disciplines, including population genetics, evolution, anthropology, archaeology, climatology, linguistics, art, music, folklore and history. This unique approach weaves a story that has synergistic impact in the clarity and level of understanding that will appeal to those researching, studying, and interested in population genetics, evolutionary biology, human migrations, and the beginnings of our

“The name Leakey is synonymous with the study of human origins,” wrote The New York Times. The renowned family of paleontologists—Louis Leakey, Mary Leakey, and their son Richard Leakey—has vastly expanded our understanding of human evolution. The Origin of Humankind is Richard Leakey’s personal view of the development of Homo Sapiens. At the heart of his new picture of evolution is the introduction of a heretical notion: once the first apes walked upright, the evolution of modern humans became possible and perhaps inevitable. From this one evolutionary step comes all the other evolutionary refinements and distinctions that set the human race apart from the apes. In fascinating sections on how and why modern humans developed a social organization, culture, and personal behavior, Leakey has much of interest to say about the development of art, language, and human consciousness.

A Choice Outstanding Academic Book A Library Journal Best Sci-Tech Book A New York Times Notable Book Once in a generation a book such as African Exodus emerges to transform the way we see ourselves. This landmark book, which argues that our genes betray the secret of a single racial stock shared by all of modern humanity, has set off one of the most bitter debates in contemporary science. "We emerged out of Africa," the authors cont, "less than 100,000 years ago and replaced all other human populations." Employing persuasive fossil and genetic evidence (the proof is in the blood, not just the bones) and an exceptionally readable style, Stringer and McKie challenge long-held beliefs that suggest we evolved separately as different races with genetic roots reaching back two million years.

Modern Humans is a vivid account of the most recent—and perhaps the most important—phase of human evolution: the appearance of anatomically modern people (*Homo sapiens*) in Africa less than half a million years ago and their later spread throughout the world. Leaving no stone unturned, John F. Hoffecker demonstrates that *Homo sapiens* represents a “major transition” in the evolution of living systems in terms of fundamental changes in the role of non-genetic information. *Modern Humans* synthesizes recent findings from genetics (including the rapidly growing body of ancient DNA), the human fossil

record, and archaeology relating to the African origin and global dispersal of anatomically modern people. Hoffeecker places humans in the broad context of the evolution of life, emphasizing the critical role of genetic and non-genetic forms of information in living systems as well as how changes in the storage, transmission, and translation of information underlie major transitions in evolution. He also draws on information and complexity theory to explain the emergence of *Homo sapiens* in Africa several hundred thousand years ago and the rapid and unprecedented spread of our species into a variety of environments in Australia and Eurasia, including the Arctic and Beringia, beginning between 75,000 and 60,000 years ago. This magisterial work will appeal to all with an interest in the ever-fascinating field of human evolution.

Ten million years ago in tropical Africa, some large primates were finally forced to stand upright and walk on two feet - this would form the beginnings of the human race. This book tells the complete story of the human evolution and the development of mankind.

How our ability to learn from each other has been the essential ingredient to our remarkable success as a species Human beings are a very different kind of animal. We have evolved to become the most

dominant species on Earth. We have a larger geographical range and process more energy than any other creature alive. This astonishing transformation is usually explained in terms of cognitive ability—people are just smarter than all the rest. But in this compelling book, Robert Boyd argues that culture—our ability to learn from each other—has been the essential ingredient of our remarkable success. *A Different Kind of Animal* demonstrates that while people are smart, we are not nearly smart enough to have solved the vast array of problems that confronted our species as it spread across the globe. Over the past two million years, culture has evolved to enable human populations to accumulate superb local adaptations that no individual could ever have invented on their own. It has also made possible the evolution of social norms that allow humans to make common cause with large groups of unrelated individuals, a kind of society not seen anywhere else in nature. This unique combination of cultural adaptation and large-scale cooperation has transformed our species and assured our survival—making us the different kind of animal we are today. Based on the Tanner Lectures delivered at Princeton University, *A Different Kind of Animal* features challenging responses by biologist H. Allen Orr, philosopher Kim Sterelny, economist Paul Seabright, and evolutionary anthropologist Ruth Mace, as well as an introduction by Stephen Macedo.
